

Accessing Network File Shares with Mac OSX

This will guide you through the setup of accessing network file shares such as magenta or eccentric.

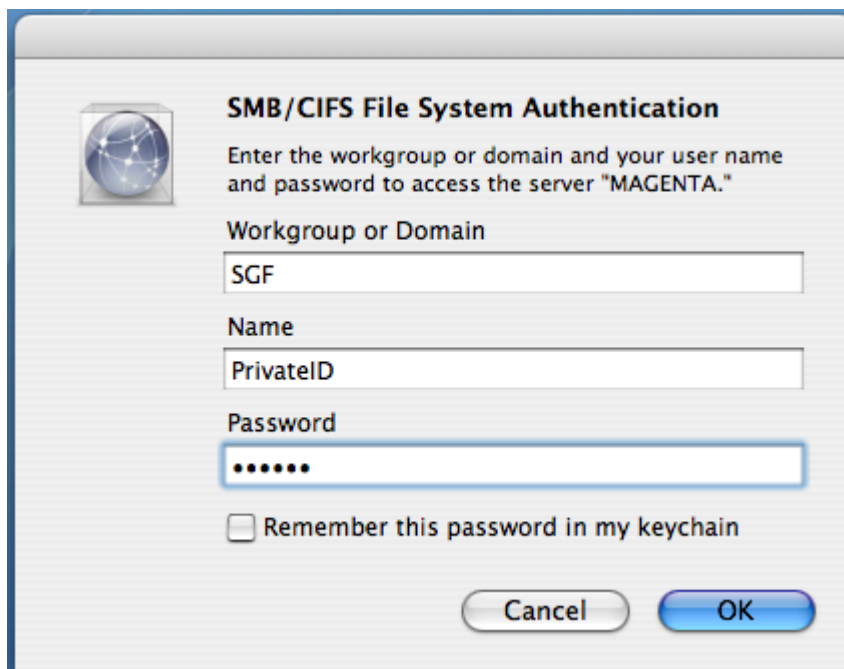

1. Select the finder from the dock.
2. From the menu bar select Go then "Connect to Server...".

3. In the dialog box, type "smb://" and then the name of the network share you would like to access (such as magenta in the example below).

4. In the authorization box that pops up, enter "SGF" as the domain, your private ID as the name.

5. Then select the folder you would like to access.
